

Rule System

None of my rules work - even the default ones that come pre-configured

So at the title states - all my rules don't work. I've ticked them all to be 'active' and none are working - even the pre-configured ones that come with the extension.

I've tested by adding "test_" as a prefix to the default naming mask, under the rules section and this does rename files to have "test_" at the start. It seems all files are doing this; pdf, jpg, mp3 etc. and not just my own rule for a specific file type. Is there something missing that I need to do?
