

Rule System

How to properly write rules for filetype sorting! Chrono Download Manager (With Screenshots)

After tinkering around for over an hour, I coded a way to properly sort all file types, as the default rules in Chrono Download Manager do not work.

Examples for rules:

Condition

```
[ext_video].has(*ext*)  
*ext*.is([ext_pdf])
```

Naming Mask

```
video/*name*.*ext*  
pdf/*name*.ext
```

Notice I ditched the `{r_done}&&` because that was literally breaking the filtering. Also, although it doesn't matter as much as I thought, it was more logical to test if a long list of extensions in a string ".has" a certain extension inside of it. Thus you'll see ".has" used except for `ext_pdf`, because it's a single extension only, which I removed from `ext_doc` and made separate.

I'll attach screenshots of my setup so you can get this tool working properly. I haven't bothered to learn more about it for now since it's working.
